Plant Simulation – Temporary project support

The most intensive and the quickest training method to address your problems is a temporary project support. Here, you would collaboratively work with me for a period of time on a simulation project.

This approach has a number of advantages:

- There is a clear focus on your areas of Plant Simulation.

- At the end you will have an executable simulation model with unencrypted methods.

- In general, objects are created that can be used in other projects and greatly simplify their creation.

- This dramatically reduces the training period in Plant Simulation.

There are a number of different approaches possible:

a. You create a project from start to finish with me. In this way, you learn the systematic approach to creating simulation projects.

b. You create and test library elements with me that you can later use independently in your own projects. I guarantee remote support when expansions and bug-fixes are needed.

c. You create the basic model yourself and we develop the necessary controls together. This allows focusing the training to SimTalk.

Duration:
variable

Costs:
per week
*3.800 € **

Training location:
On site in your company.

* The price does not depend on the number of course participants and includes all travel expenses.
